

# The Fear of Mice Content Management System

*fear of mice*

## Admin Interface

This system is based on PHP and will run with almost any back-end database – generally MySQL.

### Site Management

**Login**

Username	<input type="text"/>
Password	<input type="password"/>
<input type="button" value="Login"/>	

*fear of mice*

Users are required to login with pre-configured credentials administered by a “super-user”. User credentials will be populated with a “user level” which defines which menus (and therefore which functionality) they have available.

Users		
File Manager		

This screenshot shows a “super-user” login with access to the Admin menu.

This is a bespoke system written specifically for each client using an extensive Rapid Application Development (RAD) framework. The menus and pages available will be written individually. Each menu item references a database table with the interface reminiscent of a traditional Windows application.

The final screenshot (below) shows a typical page giving the user a GUI interface to a database table. Below the menu is a toolbar offering options to create, save, delete and print records. Below that is the database table itself – this can be configured to show a sub-set of the fields, is navigable via the buttons and is searchable (search box not shown). On clicking a record in the table, the pages detail section is populated and becomes editable. The fields support almost any data type including financial, dates, images and rich text (HTML).
